Editor's Note

The 1996 Legislature passed Substitute House Bill 2758 creating the Economic Climate Council (ECC). The ECC is responsible for selecting a series of benchmarks that characterize the competitive environment of the state. The benchmarks are indicators of the quality of life, education and skills of the workforce, infrastructure, and the costs of doing business.

Executive Summary

- **The Economic Climate Study is a snapshot of Washington’s performance and ranking both compared to other states and to its own history.**
- **The rankings are from best to worst from the perspective of businesses with a rank of one being the best.**
- **Washington’s composite rank fell from 2nd to 4th best in the nation in this year’s study.**

Washington’s Economic Climate Study

The study provides information about our competitive standing in relation to the other states

This report updates the State of Washington’s Economic Climate Study, last published in December 2020. The study provides information about Washington’s competitive standing in relation to other states. It is based on the premise that, while improving productivity is primarily the domain of Washington’s business sector, appropriate state and local policies, particularly those relating to education, public safety, infrastructure, cost of doing business, and the environment, are essential to promote higher standards of living.

Overall, forty-eight indicators are presented

The benchmarks considered in this study focus on the four themes: innovation drivers, business performance, economic growth and competitiveness, and quality of life. The category “Innovation Drivers” is broken into three sub-groups: talent and workforce, entrepreneurship and investment, and infrastructure. The category “business performance” is further broken down into business prosperity and cost of doing business. Overall, forty-eight indicators are presented.

Recent Performance

Washington declined in two of the four major categories

Washington’s rank improved in fifteen cases, worsened in sixteen cases, and stayed the same in twelve. Six indicators were not updated in this year’s climate study. Two of the four major categories in the climate study declined in rank from last year, one improved, and one was unchanged.

Innovation Drivers declined from 5th to 6th in the nation

Washington's rank in *Innovation Drivers* declined to 6th best in the nation from 5th the year before. Washington has historically performed very well in this category. This is the worst ranking in *Innovation Drivers* since data started being kept in 2002. Six of *Innovation Driver's* indicators improved while seven worsened. Five indicators remained unchanged and one was not updated. The Talent and Workforce subcategory was the worst performing, with four indicators declining. Establishment birth rate had the most significant change in terms of rank, declining 13 spots to 46th in the nation.

Business Performance improved to 4th highest

Business Performance was the only category that improved, gaining three spots to 4th best in the nation. Of the eight indicators updated (two were not updated) in *Business Performance*, Washington's rank improved in four, worsened in three, and remained unchanged in one. In the subcategory *Business Prosperity*, two indicators improved, one worsened, one was unchanged, and two were not updated. Two of the four indicators improved and two declined in the subcategory *Cost of Doing Business*. Foreign Exports had the largest change in rank, declining from 6th to 13th in the nation.

Economic Growth and Competitiveness declined to 22nd best

Washington's ranking in the *Economic Growth and Competitiveness* category fell from 7th highest to 22nd highest in the nation. Of the ten indicators in this category, two improved, three worsened, and four remained unchanged. One indicator was not updated. Washington's ranking in Per Capita Person Income Growth Rate had the largest change; dropping from 5th to 30th highest in the nation.

Quality of Life remained at 16th in the nation

Quality of Life remained at 16th in the nation in this year's study. The state's rank improved in three instances, worsened in three, and remained unchanged in two. Two indicators were not updated. Besides Air Quality which was not updated, Property Crime had the largest change in this category, improving from 5th worst to 9th worst.

This is a snapshot of Washington's performance

This report is a snapshot of Washington's ranking both compared to other states and to its own history. This analysis begins with a description of each indicator followed by a chart. Associated tables can be found at the end of each chapter. Each table ranks the states based on performance and each chart shows how Washington has fared over history. In each case, the ranking is from best to worst with a rank of one being the best.

National Ranking Index

This year's study includes an index which ranks every state

The 2021 Washington State Economic Climate Study includes the composite score of every state in the nation. These scores are then ranked in order to gauge Washington's economic competitiveness with more accuracy.

The composite score equally weights each of the four chapters and effectively takes the average of the four. Each chapter's rank is the average of the subcategories or indicators within it. This equal weighting approach was selected to minimize subjectivity regarding the importance of any given measure in constructing the composite state scores. The drawback to weighting in this manner is that indicators in different chapters have weights that may not appear reasonable. In chapters with only a few indicators, each measure is weighted more heavily than in chapters with a relatively large number of indicators.

Each state's composite score is ranked for comparison

After each state's indicators have been compiled into a composite score, these scores are then ranked. The composite score for each state equally weights each chapter and each chapter is an average of the indicator ranks that it contains. The composite score is therefore a rough approximation of where the state tends to rank on average instead of an actual ranking itself. Therefore, it is possible for two states to have almost identical composite scores. For example, Indiana and Idaho have composite scores of 24.0 and 24.1, respectively. These scores do not mean that Idaho and Ohio both rank 24th, they merely both tend to rank about 24th *on average*. In fact, Indiana and Idaho ranked 17th and 18th respectively in 2021. No composite score will actually be 1st or 50th because scores will converge around the average score of 25. This index will rank states based on how much they outperform or underperform the average score of 25. For example, the best composite score in the nation in 2021 is Utah with 18.3 while the worst is Mississippi with 33.7. The new index creates a rank that more accurately compares Washington to the rest of the nation than the composite score alone.

Figure ES.1: Washington Overall Rank

Washington has consistently ranked in the top five for more than an decade

Source: ERFC, data through 2021

Washington's composite score ranked 4th best in the nation

Washington's 2021 composite score of 19.7 means that Washington tends to rank around 20th in any given indicator on average. While this can be used to evaluate Washington's performance over time, it does not actually mean that Washington is the 20th best state; 19.7 is actually the fourth lowest composite score in the nation, which makes Washington the fourth best state in the nation based on the indicators in the 2021 Washington State Economic Climate Study.

Chapter 1: Innovation Drivers – Summary

- **Washington ranks 6th best in the nation in *Innovation Drivers* this year, down one place from the year before. Eighteen of the nineteen indicators in this category were updated; six improved, seven worsened, and five remained unchanged.**
- **In the subcategory *Talent and Workforce*, Washington’s rank improved in two indicators, worsened in four, and was unchanged in one.**
- **In the subcategory *Entrepreneurship and Investment*, the state’s rank improved in two indicators, worsened in two, and was unchanged in two.**
- **In the subcategory *Infrastructure*, Washington’s rank improved in two indicators, worsened in one, and was unchanged in two. One indicator was not updated.**

Talent and Workforce

Public Two and Four Year College Combined Participation Rate

Combined two- and four-year college participation rates allow more accurate comparisons

Washington, more than most states, relies heavily on the community college system to provide the first two years of a college education. As a result, Washington and states with similar policies have higher than average two-year participation rates and lower than average four-year participation rates. Since two- and four-year participation rates presented separately give a skewed view of Washington’s overall participation rate, this report combines the two statistics. With this adjustment, states that are more reliant on community college systems can be better compared to other states.

Washington’s combined participation rates have been declining below the U.S. average

Historically, Washington’s public two- and four-year college participation rate has been higher than the 50-state average. In the fall of 2011, however, the 50-state average rate surpassed that of Washington for the first time in the history of this index, at 6.4 percent compared to Washington’s 6.0 percent. Both the Washington and the 50-state average participation rates have been declining since 2010. In 2019, Washington’s participation rate decreased from 5.4 percent to 5.3 percent, still less than the 50-state average of 5.7. However, this year the state’s ranking

remained the same at 32nd. Washington’s average participation rate from 2015-19 is 5.5 percent, below the 50-state average of 5.8 and ranks 32nd among the states.

Figure 1.1: Public Two and Four Year College Combined Participation Rate

Education Attainment: Completed Less than 9th Grade

The Census tabulates the percent of the population with less than a 9th grade education

The U.S. Census Bureau, as a part of its annual American Community Survey, tabulates the percent of the population aged 25 years or older that has less than a 9th grade education. The less than 9th grade education indicator gives an important look at the approximate size of the pool of low-skill workers in the state economy. Additionally, this indicator has economic significance on personal incomes, as there is a positive correlation between earnings and level of education. Combined with other educational attainment indicators, this indicator helps give a complete picture of the educational attainment level of the state’s population.

In 2018, 3.5 percent of Washington’s population has less than a 9th grade education

In 2019, the Census Bureau reported that 3.5 percent of Washington’s population aged 25 years or older had less than a 9th grade education, which is the same as the previous year. While Washington’s percentage stayed the same, the state’s ranking decreased to 23rd from 19th in 2018. Washington’s percentage was significantly better than the United States average of 4.8. The state’s five-year average rank was 22nd, with a percentage of 3.7 compared to the nation’s five-year average of 5.3.

Figure 1.2: Education Attainment: Completed Less than 9th Grade

Source: U.S. Department of Commerce, Bureau of the Census; data through 2019

Education Attainment: Completed Four Years of High School or More

The Census tabulates the percent of the population that has completed high school

In the annual American Community Survey, the U.S. Census Bureau measures the percent of the population aged 25 years or older that has completed four years of high school. A completed high school level degree is necessary to continue toward associate’s, bachelor’s, or other advanced degrees, so this indicator can be seen as the portion of the population that has completed four years of high school *or more*. As one indication of the economic relevance of this measure, in 2018 the median income for a household where the householder did not graduate from high school was only \$30,627 while that of a household with only a high school diploma was \$36,441.

In 2018, Washington’s rank decreased to 17th

In Washington, 91.7 percent of the population has completed four years of high school or more in 2019, an increase from 91.6 percent in 2017. Washington’s rank decreased to 17th overall. The U.S. average was lower at 88.6 percent in 2019. Historically, Washington performed highly in this category. The state ranked in the top five nationally from 1991 (when data started being collected) to 2000. Since then, however, the state’s ranking has fallen and averaged 16th over the past five years. The state’s five-year average value of 91.0 percent remains 3.6 percentage points higher than the five-year national average of 87.3 percent.

Figure 1.3: Education Attainment: Completed Four Years of High School or More

Source: U.S. Department of Commerce, Bureau of the Census; data through 2019

Education Attainment: Completed Bachelor’s Degree or More

Higher educational attainment is associated with higher earnings

The American Community Survey, conducted by the U.S. Census Bureau, reports the percent of the population aged 25 years or older that has obtained a bachelor’s degree or higher. Measuring the number of bachelor’s degrees earned by a population is economically important because a population’s educational attainment is indicative of the skill of its workforce. Additionally, higher educational attainment is associated with higher earnings. In 2019, for example, the median income for households where the householder has a bachelor’s degree is \$62,447, while the median was \$42,030 for those with only an associate’s degree.

The state’s 2019 rank fell from 2017

Washington’s rank fell one spot to 11th in the nation for the percent of its population with completed bachelor’s degree or more in 2018. The percentage of residents age 25 or older with a bachelor’s degree or more increased from 36.7 percent in 2017 to 37.0 percent. This is higher than the U.S. average of 33.1 percent. Washington’s five-year average is 35.7 percent, placing it at 11th in the nation. The five-year national average is 31.2 percent.

Figure 1.4: Education Attainment: Completed Bachelor's Degree or More

Source: U.S. Department of Commerce, Bureau of the Census; data through 2019

Education Attainment: Research Doctorates Awarded

The NSF conducts an annual census of research doctorates received

As part of the Survey of Earned Doctorates (SED), the National Science Foundation conducts an annual census of individuals who received a research doctorate in a given academic year from an accredited institution in the United States. A research doctorate, the most common being a Ph.D., requires the completion of a dissertation or equivalent cumulating project. Professional degrees such as the M.D., D.D.S., O.D., D.V.M., and J.D. are not covered by the SED.

Washington's ranking fell from 34th in 2018 to 35th in 2019

In 2019, the number of individuals who received research doctorates in Washington was 1001. Washington awarded 16.6 doctoral degrees per 100,000 population age 18+ in 2018, a 0.4 point increase from the previous year. Washington's rank decreased, returning to 35th after improving to 34th the previous year. In 2019, the average amount of doctorates awarded per 100,000 people in the nation was 21.4. Washington's five-year average of 16.5 research doctorates awarded ranked 35th among the states and was below the national average of 21.5.

Figure 1.5: Education Attainment: Research Doctorates Awarded, per 100,000 population age 18+

Migration Rate

Washington ranks 6th overall for migration

Washington continues to be a relatively popular destination for international and domestic migration, ranking 6th in terms of total migration in 2019. Washington’s 2019 migration rate of 0.8 percent is significantly higher than the U.S. average migration rate of 0.2 percent. Washington’s five-year average migration rate is 1.1 percent, ranking 6th highest among the states listed.

Figure 1.6: Migration Rate

Source: Population Division, U.S. Census Bureau; data through 2019

Well over half of the state's population increase came from migration

Washington population growth in 2019 was 1.2 percent, while the U.S. as a whole was 0.5 percent. Natural increases accounted for 32 percent of the state's growth while 68 percent came from migration. Of the state's immigrants, 39 percent were international and 61 percent were domestic.

H-1B Visas

H-1B visas allow U.S. employers to hire foreign workers in "specialty occupations"

H-1B visas allow U.S. employers to hire foreign workers in "specialty occupations" which are defined as "requiring theoretical and practical application of highly specialized knowledge". The applicant must also have at least a bachelor's degree or its equivalent. These workers are typically hired for highly skilled jobs in technology or other specialized fields. The quantity of H-1B visa applications relative to the size of the labor force within a state is an indicator of the demand for highly skilled labor in innovative fields.

In 2019, Washington's ranking increased to 1st in the nation from 2nd in 2018; 9.92 out of every 1,000 workers in Washington held an H-1B visa. This is an increase from 8.24 in 2018. Washington's five-year average is 7.14, the second highest in the nation. In 2018, the 50-state average was 3.54 per 1,000 workers and the 5-year average was 3.39. Despite the high demand for tech-savvy workers, H-1B visa holders make up less than one percent of Washington's current labor force.

In 2019, Washington's ranking increased to 1st in the nation from 2nd in 2018; 9.92 out of every 1,000 workers in Washington held an H-1B visa. This is an increase from 8.24 in 2018. Washington's five-year average is 7.14, the second highest in the nation. In 2018, the 50-state average was 3.54 per 1,000 workers and the 5-year average was 3.39. Despite the high demand for tech-savvy workers, H-1B visa holders make up less than one percent of Washington's current labor force.

Entrepreneurship and Investment

Per Capita Spending in Research and Development, University, Industry, and Government

Research and development is a good indication of innovation

The amount of research and development activity occurring within a state relative to the size of its population provides a good indication of that state’s capacity for innovation. Industrial research and development brings new products and processes for continued growth. University and government research and development can provide basic research to support local technology hubs and can also attract funding from outside of the state.

Figure 1.8: Per Capita Spending in Research and Development, University

Source: The National Science Foundation; data through 2019

Figure 1.9: Per Capita Spending in Research and Development, Industry

Source: The National Science Foundation; data through 2018

The data are presented on a per-capita basis

The Division of Science Resources Studies (SRS) of the National Science Foundation annually compiles surveys of industries, universities, state government, and other agencies into a report titled National Patterns of Research and Development Resources.

This report indicates the state in which the research and development activity took place

This report indicates the state in which the research and development activity took place regardless of the state of the sponsoring party. The state spending figures for industrial, university, state government, and total research and development spending can be divided by the state populations to derive per capita spending. The most recent year of state spending data available is 2019 for university R&D, 2018 for industry, and 2019 for state government.

WA's rank in university R&D spending fell

In 2018, Washington's rank in university R&D spending fell one place to 21st in the nation. In 2018, Washington universities spent \$241 per capita in R&D. Washington is below the U.S. average of \$253. The five-year average for Washington State was \$232, ranking 17th.

WA's rank in industry R&D spending rank rose to 1st in the nation

For industry R&D, Washington ranked 1st in the nation in 2018, an increase from 3rd the previous year. Washington's industry R&D for 2018 was \$4,028 per capita, up from \$2,898 per capita in 2017. The five-year average for Washington State is \$2,845, well above the U.S. five-year average of \$1,177.

Figure 1.10: Per Capita Spending in Research and Development, State Government

Source: The National Science Foundation; data through 2019

WA's rank in state govt. R&D was 19th in 2019

In 2019, the Washington state government spent \$6.82 per capita for R&D. This places Washington at 19th in the nation, an improvement from 28th the year before. Government spending in Washington on R&D has consistently been lower than the U.S. average. This year the U.S. average was \$7.62. The five-year average for Washington is \$5.54, and the U.S. average is \$7.42.

Patents Issued Per 100,000 Population

Patents are a good measure of innovation

A patent issued by the United States Patent and Trademark Office grants its holder the sole right to make, use, or sell an invention. The USPTO issues five different types of patents. Some larger states will have more patents issued by virtue of a larger population. Thus, patents issued per 100,000 individuals controls for population differences and measures innovation by private persons, universities, and companies.

Washington ranks 3rd in patents issued

In 2020, Washington had 118.4 patents issued per 100,000 residents. The state's patent issue rate is almost twice the national rate of 55.6, ranking the state 3rd in the nation. In fact, Washington has been ranked 3rd in the nation for the last nine consecutive years. The two other states outperforming Washington are California (128.3) and Massachusetts (127.5). The state's five-year average of 109.4 is more than twice the national five-year average of 52.7, helping Washington also rank 3rd in that category.

Figure 1.11: Patents Issued Per 100,000 Population

2020

Venture Capital Investment

The National Venture Capital Association (NVCA) tracks the number and value of venture capital deals

The National Venture Capital Association (NVCA) tracks the number and value of venture capital deals made across different states and industries. This is reported in the NVCA’s annual Yearbook. Venture capital is typically invested in smaller, innovative companies with expectations of high growth. Therefore, venture capital investment is a measure of expectations for growth and innovation in an industry. States with high growth industries such as technology, healthcare, and business/financial services typically attract more investment than others. This indicator measures how much venture capital is invested for every \$1,000 of state GDP.

WA’s venture capital rank is 6th in the nation, at \$8.91

Washington’s venture capital investment measure increased to \$8.91 in 2020, and Washington’s rank remained at 6th in the nation. Washington is behind the national average of \$9.00, which is consistent with previous years, though the average is skewed by a few high performing states. Washington’s five-year average for venture capital investment per thousand GDP is \$5.38, 5th in the nation.

Figure 1.12: Venture Capital Investment

Source: National Venture Capital Association Yearbook, data through 2020

Establishment Birth Rate

Washington had an establishment birth rate of 7.48 in 2020

The BLS collects data on establishments through the Census of Employment and Wages and through the Business Employment Dynamics Survey. Birth rate data provides a measure of entrepreneurial activity and growth in new areas of business. The establishment birth rate is the rate of new business establishments per existing 100 establishments. An establishment birth is defined as the first time an establishment begins to pay its first employee. An establishment can be either an entirely new firm or could be a new branch, plant, or expansion of an existing firm. The BLS does not include a seasonal business reopening as a new establishment.

Washington ranked 46th in establishment birth rate in 2020

Washington’s establishment birth rate has varied wildly, particularly in recent years. From 2001 to 2011, Washington’s ranking in establishment birth rate was always above 15, and was even 1st in the nation in 2009. The previous worst ranking was 44th in 2015, and Washington earned 1st place in both 2009 and 2018. In 2020, Washington’s establishment birth rate was 7.48, earning a ranking of 46th, the new lowest birth rate and ranking for the state. The five year average for Washington is 10.14, above the United States average of 9.82, which places Washington at 18th place.

Infrastructure

Interstate Miles in Poor Condition

Since 1990 the FHWA has collected data on highway statistics

Since 1990, the Federal Highway Administration (FHWA) has required states to report road roughness according to the International Roughness Index (IRI), a set of standard codes dictated by the Highway Performance Monitoring System Field Manual for the Continuing Analytical and Statistical Database. This information is then collected and published in a consistent format in the [FHWA's Highway Statistics](#). This indicator reports the percentage of interstate miles that have an IRI of 171 or greater.

Washington's ranking increased to 38th in 2019

The percent of interstate roads in poor condition decreased to 4.6 percent in 2019 from 6.3 percent in 2018. This is 2.6 percentage points above the U.S. average of 3.2 percent. In 2019 Washington was ranked 38th in the nation, an increase from 44th the last year. The five-year average is 5.8 percent, placing Washington 42nd in this category.

Figure 1.14: Interstate Miles in Poor Condition

FAA Air Traffic Delays

The FAA provides air traffic information for all FAA contract airports

The Federal Aviation Administration’s (FAA) annual Air Traffic Activity and Delay Report provides air traffic information for all airport facilities under contract with the FAA in each state. Air traffic delays can occur at any phase of the flight and are characterized as delays that exceed 15 minutes. For comparison purposes, this indicator measures the number of delays per 1,000 operations in each state.

The number of delays in Washington was 1.4 per 1,000 in 2020

Flight operations and delays were much different in 2020 compared to previous years due to flight restrictions caused by the pandemic. In 2020, the number of delays per 1,000 operations was 1.4, a decrease from 5.7 the year before. This improved Washington’s ranking from 44th place to 40th place. Washington’s five-year average of 4.1 is slightly higher than the U.S. average of 3.5. Washington ranked 42nd due to the many states with zero average delays.

Figure 1.15: FAA Air Traffic Delays

Households with a Broadband Internet Subscription (Percent)

This is the second year that this indicator has been used in the climate study

Broadband infrastructure is an important part of improving economic development, public safety, and education. Now that internet services are a large part of the economy, having access to a broadband subscription is essential to staying aware of and educated about the evolving world around us. The United States Census Bureau, as part of its American Community Survey, has listed the percent of households with a broadband internet subscription from each state. This is the second year that this indicator has been used in the climate study.

About 9 out of 10 households in Washington have a broadband internet subscription

The percentage of households with a broadband internet subscription has increased across the nation over time. In fact, in the time span between 2013 and 2018, the United States average has increased over 10 percentage points (72.8 to 85.4). Washington has experienced these same trends, with its percentage increasing over 10 percentage points in that same time period as well (78.9 to 90.1). Washington has also seen very high rankings over the past five years, ranking either first or second in the nation. In 2018, Washington ranked 2nd in the nation, and its percentage increased 0.7 percentage points to 90.1 percent. This value indicates that about 9 out of 10 households in Washington have a broadband internet subscription.

Figure 1.16: Households with a Broadband Internet Subscription (Percent)

Unlinked Passenger Trips Per Capita

The FTA tracks public transit use

Public transportation systems are a key part of the infrastructure of economically competitive states. The Federal Transit Administration measures public transportation usage through unlinked passenger trips (UPTs), where each leg of a passenger’s journey counts as a use of the public transit system. For example, if a commuter uses the train and then bus to commute to work, their journey will be recorded as two unlinked passenger trips, as they used public transit twice on their way to work.

Washington ranks 6th in public transit use

Washington’s ranking remained the same at 6th in the nation in 2018. Per capita, Washington residents used public transit 35.9 times, which is higher than the U.S. average of 29.3 during the same period. For 18 years Washington has outperformed the U.S. average. Washington’s five-year average is 35.9 trips per capita. The U.S. five-year average is 31.2.

Figure 1.17: Unlinked Passenger Trips Per Capita

Rail Freight Value

This indicator measures the total trade value of goods transported

The Bureau of Transportation Statistics provides data on the commodity type, port, and dollar value of exports and imports between NAFTA trade partners. This indicator measures the total trade value of goods transported by each state’s railways originating from or destined for other states, Canada, and Mexico. Rail freight value measures a state’s trade infrastructure and ability to move goods through North America by rail.

In 2019, Washington moved \$1.96 billion in freight over railways, ranking 18th in the nation

In 2019, Washington’s railways moved \$1.96 billion in freight while the 50 state average was \$3.58 billion. Washington’s rail freight value historically ranks lower than the U.S. average. Despite a decrease in value, Washington’s ranking remained at 18th. Washington’s five-year average rail freight value is \$1.5 billion, and the U.S. five-year average is \$3.45 billion.

Chapter 2: Business Performance – Summary

- **Washington’s rank improved from 7th to 4th best in the nation in *Business Performance* this year.**
- **Of the ten indicators in this category, four improved, three worsened and one was unchanged. Two indicators were not updated.**
- **Business Performance has been broken out into two subcategories: *Business Prosperity* and *Cost of Doing Business*.**
- **In the subcategory *Business Prosperity*, Washington’s rank improved in two indicators, worsened in one, one was unchanged, and two were not updated.**
- **In the subcategory *Cost of Doing Business*, two indicators improved and two indicators worsened.**

Business Prosperity

Foreign Exports Inclusive and Exclusive of Transportation Equipment

In 2020 Washington’s foreign exports totalled 6.13 percent of personal income, ranking 13th in the nation

In 2020, Washington’s ranking in foreign exports as a percent of personal income decreased to 13th place from 6th the year before. Washington’s foreign exports were 7.83 percent of personal income in 2019, a drop of 4.41 percentage points from the year before. Despite the decrease, Washington’s rate remains well above the national average of 3.46 percent. Many states saw a drop in exports due to Covid-19 shutdowns. Number-one-ranked Louisiana had exports constituting 25.11 percent of personal income. Washington is 6th in its five-year ranking with 14.77 percent, with Texas ranked 2nd and Louisiana ranked 1st. Louisiana ranks high in this category due largely to its exports of petroleum products.

Washington exports are led by transportation equipment

Washington’s perennially strong performance in this category is due mainly to the presence of Boeing and PACCAR, two of the world’s leading manufacturers of commercial aircraft and trucks, respectively. Exports of transportation equipment from these and other Washington manufacturers typically account for over half of Washington’s exports. Excluding the exports of these products, Washington’s exports were equivalent to 6.13 percent of personal

income in 2020 compared to 5.94 percent for the U.S. Washington returned to higher than the state average, after falling below for the first time in 2019. The state's ranking improved one spot to 15th in 2020. For the past five years, Washington's average rank has been 15th in the nation.

Figure 2.1: Total Foreign Exports

Source: U.S. Department of Commerce, Bureau of the Census, Foreign Trade Division, Bureau of Economic Analysis; data through 2020

Figure 2.2: Foreign Exports Excluding Transportation Equipment

Source: U.S. Department of Commerce, Bureau of the Census, Foreign Trade Division, Bureau of Economic Analysis; data through 2020

It must be noted that the trade data used for this indicator, obtained from the U.S. Bureau of the Census, only include trade in goods, ignoring trade in service exports, which are difficult to

Trade in services, which Washington does well in, are not included in this measure

track and credit to specific states. Software, one of Washington’s main exports, is classified as a service when it is not exported on physical media and is therefore not included in the Census measure. As software giant Microsoft contributes greatly to state personal income while the majority of its exports are not included in the trade data, the measure of Washington exports as a percent of personal income understates the contribution of trade to Washington's economy.

High Wage Industries’ Share of Total Employment

Average wages and salaries are derived from data published by the BEA

As part of its annual release of personal income data, the U.S. Bureau of Economic Analysis (BEA) publishes wages and salaries by industry and full-time and part-time employment by industry for each state and the nation as a whole. The BEA publishes state level data for 93 industry categories corresponding to various combinations of two- to four-digit North American Industry Classification System (NAICS) categories. By dividing wages and salaries by full-time and part-time employment, average wages and salaries can be computed for each industry.

Figure 2.3: High Wage Industries’ Share of Total Employment

Source: BEA, Washington State Office of the Economic and Revenue Forecast Council; data through 2019

High wage jobs are jobs in industries whose average wages and salaries are above the national average

In 2019, overall average wages and salaries in the United States was \$ 59,451 per full-time and part-time job. This measure defines “high wage jobs” as those in industries whose average wages and salaries are higher than the overall average for all industries. The high wage industries are selected based on the data for the United States as a whole. The number of jobs in each state that are in the industries categorized as high wage is divided by the total number of jobs to determine the high wage

industries' share of total employment. Annual growth in high wage industries' share of total employment is calculated as the percent share of jobs that are high wage in a given year minus the percent share of the previous year. It should be noted that the BEA employment statistics used in computing this measure are slightly different from the U.S. Bureau of Labor Statistics (BLS) employment statistics reported elsewhere in this publication.

The currently defined ratio is much more cyclical than the previously defined ratio

In our 2015 report we noted that the ratio of high wage jobs to total jobs in Washington State has been increasing since 2004. The current tabulation, however, shows an increasing trend only since 2012. The reason is that in the data for 2015 onward, specialty trade contractors, which accounts for about 60% of construction employment, is a higher-than-average-wage sector. Previously it was not. The other 40% of construction employment has always been considered high wage. As construction in general waxes and wanes, the two groups of construction employment used to offset each other. Now they do not. The result is a much more cyclical ratio of high wage to total employment.

Washington's above average growth can be attributed to nonstore retailing, IT and construction

Washington's above average growth in the high wage share can be attributed to nonstore retailing, information technology, and construction. Nonstore retailing was the single largest contributor to Washington's above average performance. In Washington State, electronic shopping (e.g. Amazon) accounts for nearly all of nonstore retail employment. Washington nonstore retail employment increased 113% from 2010 to 2015 compared to just 17% for the nation. Publishing industries except internet employment (94% software in Washington), data processing, hosting, and related services employment, and "other" information services employment (98% internet publishing and web search portals in Washington), also all grew much faster in Washington than in the U.S. as a whole. Finally, Washington has been exceeding the nation in construction employment growth in the last five years. Together, these industries more than account for the difference between the growth of the high wage share in Washington and the high wage share in the nation.

Washington's high wage ratio exceeds the national average

Washington's ratio of high wage jobs to total jobs has exceeded the national average since 2013. Over this period, Washington's rank has steadily improved each year. In 2012, Washington ranked 24th in the nation and has since improved to 8th highest in 2019.

Figure 2.4: Growth in High Wage Industries' Share of Total Employment

Source: BEA, Washington State Office of the Forecast Council; data through 2019

Washington growth in its share of high-wage jobs ranked 4th in 2019

Washington’s rank in the growth of its share of jobs in high wage industries has fluctuated greatly over the years. As recently as 2012, Washington ranked second worst in the nation. Following that low point, the state’s ranking improved and reached best in the nation in 2015. In 2019, Washington improved its rank from 23rd to 4th in the nation. Washington’s five-year average ranks 2nd amongst the states.

Value Added Per Hour of Labor in Manufacturing

Value added is the difference between raw and final goods value

Value added is a measure of manufacturing activity derived by subtracting the value of raw materials from the value of finished, final goods. An industry’s total value added represents the amount of revenue the industry has available to pay wages, rent, taxes, interest, profit, and all other business costs aside from raw materials.

Data is presented in 3-year moving averages

The data used to estimate Value Added per Hour of Labor in Manufacturing is from the Annual Survey of Manufactures (ASM), published by the Census Bureau. The ASM provides estimates of worker hours and value added for all manufacturing establishments with one or more paid employees. However, because the ASM is a sample survey, its estimates possess varying margins of error. To minimize the effects of these errors, the data in Table 2.5 are presented as three-year moving averages.

Figure 2.5: Value Added Per Hour of Labor in Manufacturing

Source: U.S. Department of Commerce, Census Bureau, Annual Survey of Manufactures; data through 2017

The amount of value added differs greatly across industries

The amount of value added per hour of labor varies greatly among different industries in manufacturing. Highly automated industries such as semiconductors have very high value added per hour since one person can operate a machine that puts out a large volume of high-value product, while less automated industries such as furniture manufacturing require more labor per dollar of added value. (Highly automated industries, however, also have much higher equipment costs, so high value added does not necessarily imply high profit.) Within a specific industry, interstate differences in value added per worker hour may be interpreted as differences in worker productivity between states.

Non-weighted values are unadjusted for industry mix

The differences in value-added across industries makes a state's average value added per worker-hour highly dependent upon its particular industry mix. The "Non-Weighted" values presented in Table 2.5 do not account for different industry concentrations among states. Thus, states with a large percentage of high value added industries, such as semiconductors in New Mexico, perform very well in this measure. Washington also performs well, indicating an industry mix of higher-than-average labor productivity, ranking 6th in the most recent period.

Weighted value added figures assume each state has an identical mix of industries

To minimize the effects of industry mix on estimates of state productivity, the "Weighted" values in Table 2.5 represent value added per worker hour as if each state had an identical mix of industries. In this case, each state's worker hours in all of the 21 major NAICS manufacturing groups were adjusted to be identical in proportion to the national average.

The weighting system can be problematic

This weighting method, however, is still susceptible to error for two main reasons. The first reason is that most states are either completely lacking in several industries or have only one representative of an industry, which makes the data unreportable by the Census due to disclosure laws (though the data are included in the totals). Alaska and Hawaii no longer report statewide manufacturing data, so these states are omitted. These omissions are treated as an undifferentiated "remainder" industry that can skew a state's average greatly depending upon what the productivity of the hidden industry is and the proportion of total hours the remainder represents. The second reason is that there is still a large degree of productivity variation within major NAICS categories. For example, NAICS group 334 includes semiconductor manufacturing along with computer, electronic instrument, and other electronics manufacturing industries with much lower labor productivity than semiconductors. Each state is given the same number of hours in group 334, therefore, those states who have a large percentage of semiconductor worker hours in that group will still record higher-than-average productivity in that group. For this reason, New Mexico still performs above average in the weighted results. Nevertheless, by accounting for most of the industry mix variation, the weighted results can still provide a general idea of where each state lies in the labor productivity spectrum.

Washington ranks well in both the weighted and non-weighted categories

Looking at the weighted measure, Washington's average value added per worker hour is lower due to the neutralization of its industry-mix advantage. Washington's weighted ranking returned to 7th in the 2015-2017 period after falling to 16th in the 2014-2016 period. Washington's weighted value added was slightly higher than the U.S. average. In the "Non-Weighted" category, Washington greatly outperforms the national average. The state's three-year average value added per hour of labor is \$230.54, whereas the national value is \$178.44. Despite unweighted value added increasing from the period before, Washington remained ranked at 6th in the 2015-2017 period.

Cost of Doing Business

Electricity Prices

Electrical power represents the main energy cost for most businesses

Electrical power represents the main energy cost for most businesses, except for large industrial facilities relying extensively on fuel oil or natural gas. This indicator presents the average price of the commercial and industrial electricity purchases made annually in each state, expressed in cents per kilowatt-hour (kW-hr). To facilitate comparisons between states, each state is assumed to have had the same ratio of commercial to industrial sales as the U.S. in each year.

Figure 2.6: Electricity Prices

Source: U.S. Energy Information Administration (<http://www.eia.doe.gov>), data through 2020

Washington is 7th in the nation for electricity prices in 2020

Due to the state’s abundant hydrological resources, Washington has long enjoyed some of the lowest electricity prices in the country. From 2009 through 2018, the state ranked either 1st or 2nd in the nation before dropping to 4th in 2019. In 2020, Washington’s rank continued to drop to 7th in the nation. The state’s cost of electricity was 7.33 cents per kilowatt-hour, up from 7.11 in 2019. Washington’s five-year average of 6.89 cents per kilowatt-hour ranks third best in the nation, while the U.S. five-year average is 8.88 cents.

State and Local Tax Collections Per \$1,000 Personal Income

Taxes relative to personal income provides a good measure of tax burden

The relative tax position of Washington is of considerable interest to taxpayers and government officials alike. The Census Bureau of the U.S. Department of Commerce annually collects data in order to compare tax burdens across states. Using this figure, tax burdens are then calculated using several different methods; this report compares tax collections per \$1,000 of personal income. This measure is computed by dividing total state and local taxes by total state personal income. It is important to note a gap in the data in 2001 and 2003. The 2001 recession limited data collection during those periods.

WA’s tax burden has been below the national average for 17 straight years

Washington state tax collections per \$1,000 of personal income increased in 2018 to \$100.90 from \$97.44 the year before. With this increase, Washington’s ranking dropped from 2^{1st} in the nation to 27th. Washington’s tax collections were below the U.S. average of \$101.82. Washington’s rank on average from 2014 to 2018 was 22nd, with \$96.76 per \$1,000 personal income.

The WA DOR estimates that households pay 56 percent of the tax burden

The "initial incidence" of a tax refers to the party from whom the tax is collected. Initial incidence does not always indicate who actually bears the tax burden, because taxes initially paid by business may sometimes be recovered in the form of higher prices or lower wages, shifting the tax burden to consumers or workers. The Washington Department of Revenue estimates that households pay 56 percent of total state and local taxes collected, while businesses, tourists, and the government pay the rest.

Figure 2.7: State and Local Tax Collections Per \$1,000 Personal Income

Source: Washington State Department of Revenue, Data through 2018

Unemployment Insurance Costs

UI benefits provide security to the jobless

Unemployment insurance programs are designed to provide economic security against the effects of unemployment by providing temporary compensation to workers who are out of work at no fault of their own.

UI is a combined state-federal system

Unemployment insurance is provided by a combined Federal-State system, primarily financed through a payroll tax on employers. Under this system, the Federal Government sets minimum standards of eligibility and benefits that the states are free to exceed. As a result, there is a wide degree of variation in the eligibility for and benefits paid under the unemployment insurance programs of different states, as well as variation in the number of employers that pay into the programs. This measure indicates the amount that each state collects for unemployment insurance benefits as a percent of the total wages of employees covered by the plans.

WA has historically had above-average UI costs

Washington has historically had one of the higher-cost unemployment insurance programs in the country but in recent years those costs have trended towards the national average. In 2020, Washington’s average unemployment insurance cost as a percent of the total wages of covered employees was 0.48 percent, down from 0.53 percent in 2019. The national average rate for 2020 declined to 0.45 percent from 0.48 percent. The state’s rank in 2020 jumped to 25th from 30th the previous year. Washington’s five-year average of 0.61 percent ranked 29th lowest in the nation.

Figure 2.8: Unemployment Insurance Costs

Source: U.S. Department of Labor, Employment, and Training Administration; data through 2020

Workers’ Compensation Premium Costs

Figure 2.9: Workers’ Compensation Premium Costs

Source: Oregon Workers' Compensation Premium Rate Ranking; data through 2020

Index is updated every two years

The Oregon Department of Consumer & Business Services produces the workers' compensation premium index every two years in order to make a state-by-state comparison of workers' compensation premiums. The premium index is calculated by selecting Oregon's fifty largest business classes as defined by the workers' compensation costs and computing what those compensation claims would cost in other states.

WA's rank was 29th in 2020, an increase of 6 spots

In 2020, Washington's premium costs for the industries examined by the study were \$1.53 per \$100 of payroll, a decrease of \$0.34 per \$100 of payroll in 2018. The state's rank improved from 35th in 2018 to 29th this past year. Washington's average rate of \$1.90 per \$100 of payroll for the period from 2012 through 2020 ranked 33rd among the states and was slightly above the national average of \$1.76.

WA's system is atypical of other states'

Washington's compensation system is atypical of other states' systems as employees pay a portion of their industrial premiums into a state fund and the Department of Labor and Industries acts as both the insurer and administrator of the workers' compensation system.

Chapter 3: Economic Growth and Competitiveness – Summary

- **Washington’s rank fell from 7th to 22nd best in the nation in *Economic Growth and Competitiveness* this year.**
- **The state’s rank improved in two indicators, worsened in three, and remained unchanged in four. One indicator was not updated.**

Per Capita Personal Income

Washington is 6th in the nation for per capita personal income

Personal income, as defined by the Bureau of Economic Analysis, is the sum of earnings, dividends, interest, rent, and transfer payments. The per capita personal income indicator is calculated by dividing the total personal income of a state by its population. In 2020, per capita personal income in Washington was \$68,322. This is over \$8,000 more than the U.S. average of \$59,729.

Figure 3.1: Per Capita Personal Income

Source: Bureau of Economic Analysis, U.S. Department of Commerce; data through 2020

Washington’s five-year average is \$61,887, which is also higher than the U.S. average of \$54,575. While income has continued to increase, Washington’s ranking stayed the same at 6th. Washington has been in the top 17 since the start of our collected data in 1929.

Most of Washington’s personal income derives from earnings

Most of Washington’s personal income derives from earnings, which consists mainly of wages and salaries but also includes proprietor’s income and other labor income. In 2020, net earnings by place of residence for Washington residents totaled \$321.7 billion, which accounted for 61.2 percent of total personal income. Income from transfer payments was \$93.2 billion, up \$25 billion from 2019 due to increased government assistance during the pandemic. Income from dividends, interest, and rent was \$110.7 billion, representing 21 percent of total personal income.

Per Capita Personal Income Growth Rate

WA per capita personal income grew by 5.5 percent, with a rank of 30th

The per capita personal income growth rate describes how quickly personal income is growing for a given population, and this growth rate is affected by the growth rate of the components of total personal income and the growth rate of the population. Washington’s per capita personal income growth rate was 5.5 percent in 2020, up 1.3 percentage points from 2019. Washington’s rank declined to 30th in the nation, due to high rates of growth in other states. Washington’s ranking had been improving prior to this year, and was 5th in the nation in 2019. Washington’s rank has fluctuated drastically over the years, and even was ranked 50th in 2001. From 2015-2019, Washington’s average ranking was 4th in the nation.

Regional Price Parities – Relative Value of \$100

RPPs measure geographic differences in price levels

Regional Price Parities (RPPs), published by the Bureau of Economic Analysis, measure geographic differences in the price levels of goods and services. RPPs are weighted averages. To simplify comparisons, this indicator uses the United States as a base of 100. We then compare states in terms of relative value of \$100. For example, if a state's value is 95, \$100 only buys \$95 worth of goods and services in that state compared to the nation. In other words, prices in that state are on average about five percent higher than the U.S. average (5.3 percent to be more exact). States with a lower relative RPP value have higher price levels.

Washington ranked 45th in 2019

In 2019, the relative value of \$100 in Washington was \$92.30. Washington's ranking in 2019 stayed the same at 45th in the nation. Washington's five-year average is \$93.3, ranking 44th.

Figure 3.3: Washington Regional Price Parity

Source: Bureau of Economic Analysis, U.S. Department of Commerce, data through 2019

Total Employment Growth Rate

In 2020 Washington's ranking for employment growth rate declined to 22nd in the nation.

With the onset of the 2007-09 recession, employment dropped across the United States and the U.S. average annual employment growth rate fell to -0.4 percent in 2008. Despite the nation-wide recession, Washington still had positive employment growth for the year at 0.9 percent, ranking the state 8th in the nation. In 2009, as the recession continued, U.S. average annual employment growth fell to -4.5 percent, the lowest since the Great Depression. Washington suffered along with the nation as annual employment declined 4.4 percent. When the national labor market started to turn a corner, Washington lagged in job growth. In 2010, the state's employment decline was worse than the national average pushing Washington's ranking to 13th worst

in the nation. Since 2010, Washington employment growth has rebounded, reaching a high of 5th highest in the nation in 2017 and 2018. With the onset of the pandemic and subsequent measures to address it, employment growth fell both nationally and in Washington. In 2020, employment growth fell 6.3 percent in the U.S. Washington’s employment growth fell 5.3 percent in 2020. Washington’s rank declined to 22nd in the nation from 8th the year before. From 2016 to 2020, Washington’s average employment growth rate was 0.9 percent, ranking 5th highest in the nation.

Figure 3.4: Total Employment Growth Rate

Real Median Household Income

Median income measures avoid bias due to extremely high or low incomes

A state’s median household income is the level of income (before taxes) at which exactly half of that state’s households earn more than that amount and half earn less. While it is related to average or per capita household income, an increase in average household income does not necessarily mean that median household income will increase and vice versa. Unlike average income, median income measures are not biased by the income levels of the highest-income or lowest-income households. Typically, the average or per capita household income of a state is higher than the median.

The standard error for Washington’s 2020 median household income estimate is \$3,095

Annual median household income estimates for states are produced by the U.S. Census Bureau. The data presented here are in current dollars. These estimates are derived from the Annual Social and Economic Supplements to the annual Current Population Survey. As this survey’s primary purpose is to arrive at national income and demographic numbers, estimates for individual states have substantial margins of error. The standard

error for Washington’s 2020 median household income estimate is plus or minus \$3,095 compared to \$475 for the United States.

The state’s median income decreased to \$81,083 in 2020

Real median household income decreased to \$81,083 in 2020 from \$82,454 the year before. Despite the decrease, Washington’s rank remained at 8th in the nation. These results are most likely due to impacts from Covid-19 shutdowns and layoffs. Washington has always been above the U.S. median. The U.S. median income for 2019 was \$67,521. The five-year average of the annual median for Washington is \$77,798, compared to the five-year U.S. average of \$63,963. Washington’s five-year ranking is 5th in the nation.

Figure 3.5: Real Median Household Income

Source: U.S. Department of Commerce, Bureau of the Census; data through 2020

Unemployment Rate

Washington ranked 39th in the nation for unemployment rate

Washington’s unemployment rate has increased from 4.1 percent in 2019 to 8.4 percent in 2020. This sharp increase is seen due to business shutdowns caused by the Covid-19 pandemic. Washington’s unemployment rate has typically been above the U.S. average, and the 2020 U.S. average was 5.3 percent. Washington remained at 39th in the nation in 2020, after hitting a low of 40th in 2018. Washington’s five-year average unemployment rate is 5.3 percent, 36th in the nation. The U.S. five-year average is 5.0 percent.

Figure 3.6: Unemployment Rate

Source: U.S. Department of Labor, Bureau of Labor Statistics; data through 2020

Housing Affordability Index

The HAI measures housing affordability based on median income and home value

The Housing Affordability Index (HAI) is a measure of how affordable median priced homes are to families earning median incomes. For this indicator, HAI scores are calculated using annual estimates for median household income and median home value from the U.S. Census Bureau’s American Community Survey. HAI scores are also based on the annual percentage rates for mortgage loans given by Freddie Mac and assume a 20 percent down payment.

Figure 3.7: Housing Affordability Index

The baseline HAI value is 100

At an HAI of 100, a family earning the median income has exactly enough income to qualify for a mortgage on a median-priced house. Higher index values – above 100 – indicate homes are more affordable; lower index values mean homes are less affordable. For example, an HAI value of 125 means that a median income household has 125 percent of the income necessary to qualify for a median priced house.

Washington’s HAI in 2019 was 120, placing it 44th in the nation

In 2019, Washington’s HAI was 120, up from 111 in 2018. The U.S. average HAI was 161 in 2019. Washington has historically been below the U.S. average HAI. Washington’s ranking declined to 44th in the nation from 43rd the year before. Washington’s five-year average HAI is 123, placing it at 44th in the nation.

Income Spent on Rent

Income spent on rent helps measure housing affordability

The U.S. Census Bureau’s American Community Survey tracks both median contract rent and median household income. Median contract rent is the median amount of monthly rent that is agreed to or contracted for, not including utility payments, fees, meals, or other services. For vacant units, contract rent is the monthly price asked for the unit at the time of interview. Combining contract rent and income data into one indicator – income spent on rent – helps measure shelter costs as well as housing affordability. Renters are typically advised to spend no more than 30 percent of their incomes on rent.

Figure 3.8: Income Spent on Rent

In 2019, Washington ranked 7th worst in the nation for income spent on rent

Washington's median rent as a percentage of median income was 17.9 percent in 2019, ranking 44th. This is a 0.4 percentage point increase from the year before. Some of the more expensive states, or states with larger portions of incomes being spent on rent, include: California, New York, Florida, Hawaii, and New Jersey. The five-year average for Washington is 17.3 percent, while the national five-year average is 17.1 percent. Washington ranked 39th in the nation over the period.

Total Average Wage and Average Wage by Occupation

The OES program produces estimates for over 800 occupations

The Occupational Employment Statistics (OES) program, produced by the U.S. Department of Labor's Bureau of Labor Statistics, conducts a yearly mail survey to gather estimates of employment and wages for specific occupations in states and metropolitan areas. The OES program collects data on wage and salary workers in nonfarm establishments in order to produce estimates for over 800 occupations. Because of the survey technique, data about self-employed workers are not collected and not represented in these estimates. Under the OES program, occupations are classified under the Standard Occupational Classification (SOC) system. This system includes twenty-three major occupational groups, which can be broken down into 840 individual occupations. Total average state wages are shown in Table 3.9 and state wages for major groups are presented in Table 3.10. Wages for the 840 specific occupations can be found at the BLS web site (www.bls.gov).

Washington ranks within the top ten in 18 categories and 4th overall

In 2020, Washington ranked in the top ten nationally in eighteen out of twenty-two categories. The state reaches a ranking of 1st in Computer and Mathematical occupations as well as Personal Care and Service Production. Washington also ranked 2nd in Protective Services, Building and Grounds Cleaning and Maintenance, Food Preparation and Serving, and Healthcare Support. On the other hand, Washington ranked lowest in the category of Farming, Fishing and Forestry, with a ranking of 17rd in the nation. Washington's total average hourly wages were \$32.15. This is an increase of \$2.33 from 2018. Washington's rank increased to 3rd in the nation. This is the best the ranking has ever been. For 16 years the ranking has consistently hovered around either 7th or 8th. Washington has also been consistently higher than the U.S. average. From 2015 to 2019, the average hourly wage was \$29.00, ranking 4th.

Wages alone cannot be used to analyze costs since productivity must also be taken into account

While information on average state wage levels alone can be useful in some business decisions, care must be taken in using them to analyze actual business costs. This is because the OES survey does not attempt to account for differences in productivity or industry mix between the states. A higher-than-average wage level may simply indicate a larger concentration of high-productivity jobs within an occupational group, or higher productivity levels in the same occupation due to differences in

average state levels of capital or training. For example, Washington’s relatively high average wage in Healthcare Support may be due to a higher-than-average number of higher-paid workers in biotechnology labs rather than having higher paid doctors and nurses. Additionally, there are considerable differences in wage levels between different parts of the state, with the highly populated areas affecting the average wage more than more sparsely populated areas that may have lower wages. The specific occupational and metropolitan area data available from the OES can present a clearer picture of the range of labor costs in the states.

Real Per Capita GDP

This is the broadest indicator in the climate study

The Bureau of Economic Analysis reports each state’s real gross domestic product per capita annually. This is calculated by measuring the income and benefits of labor, total business taxes, and capital income, including depreciation. The total is chained with 2012 dollars and divided by the state population. This is the broadest indicator in the climate study and measures how much each state produces in goods and services per citizen, accounting for inflation.

Washington ranks 3rd best in the nation in real per capita GDP

Washington’s per capita GDP decreased from \$72,063 to \$70,790 in 2020 while the state’s rank improved to 3rd in the nation. This decrease was the result of the Covid-19 pandemic and shutdowns that resulted. The 50-state average was \$55,924. The five-year average for Washington State is \$68,397 compared to \$56.387 for the 50-state average. Washington’s rank in that same period is 6th.

Chapter 4: Quality of Life – Summary

- **Washington’s rank remained at 16th best in the nation in *Quality of Life* this year.**
- **The state’s rank relative to other states improved in three indicators, worsened in three, and remained unchanged in two. Two indicators were not updated.**

Property Crime, Violent Crime Rate, Arrests Per Violent Crime

The FBI generates consistent criminal statistics across states

Due to former discrepancies including variable reporting methods, crime definitions, multiple reports for different arrests, charges and convictions for a crime, the International Association of Chiefs of Police established the Uniform Crime Reporting (UCR) program. Reported by the U.S. Federal Bureau of Investigation (FBI), the program’s primary objective is to generate a reliable set of criminal statistics by mandating specific reporting requirements and criteria for gathering data.

Figure 4.1: Property Crime Rate

Source: U.S. Department of Justice. Federal Bureau of Investigation; data through 2019

Nationwide this statistical effort includes data from over 17,000 cities, counties, and state law enforcement agencies, with data in this report going back to 1991.

Figure 4.2: Violent Crime Rate

Figure 4.3: Arrests per Violent Crime

Source: U.S. Department of Justice. Federal Bureau of Investigation; data through 2019

Washington's violent crimes rank increased to 20th

Property crime improved to 42nd while arrest rate fell to 21st

In 2019, Washington's violent crime (murder, non-negligent manslaughter, forcible rape, robbery, and aggravated assault), as measured per 100,000 people, decreased from 312 in 2018 to 294 in 2019. Washington's 2019 ranking was 20th in the nation, up from 23rd the year before. The property crime (burglary, larceny-theft, motor vehicle theft, and arson) rate in Washington, also measured per 100,000 people, decreased to 2,682 crimes from 2,946 the year before. Washington's rank increased to 42nd in the nation for property crime. In Washington there were 0.36 arrests per violent crime in 2019, a decrease of .06 from last year. However, Washington's rank decreased one place to 21st in the nation.

Air Quality

The United Health Foundation measures air pollution

Air quality is measured by the amount of micrograms of fine particles per cubic meter in the air we breathe. The United Health Foundation measures air pollution by particulate matter of 2.5 microns and smaller. The smaller particles are, the more risk there is for health problems. Particulate matter of 2.5 microns or less is known as fine particulate, which is found in smoke and haze.

Data show the micrograms per cubic meter in each state

Air pollution is monitored in places where population density is significant or where pollution has been a problem in the past. The average exposure of the general public to fine particles is found by pollution reports provided by each county reporting in a state, which is weighted by population. In counties where pollution data are not available, it is assumed that pollution is equal to the average of the lowest reported pollution areas in the state or region for each of the last three years. The data report the micrograms of fine particles per cubic meter in each state.

Figure 4.4: Air Quality

Source: U.S. Environmental Protection Agency. National Air Quality and Emissions Trends Report; data through 2020

Air pollution in WA increased, and rank worsened

In 2020, there were 8.3 micrograms of fine particles per cubic meter in Washington, an increase from 8.0 in 2019. This was the first time since that Washington hasn't been below the national average with data going back to 2003. The national average was also 8.3, down from 8.4 the year before. Washington's ranking dropped 5 spots to 39th in the nation. Washington's five-year average was 8.1 micrograms, and had a ranking of 35th in the nation.

Drinking Water

Public water systems must abide by the standards established by the EPA

Public water systems must abide by the standards established by the Environmental Protection Agency (EPA) under the federal Safe Drinking Water Act (SDWA). These standards are designed to prevent microbial, chemical, and radiological contaminants in drinking water, and to assure the protection of public health if contamination does occur. The number of contaminants regulated by the EPA has risen from 23 in 1986 to over 100 today.

Figure 4.5: Drinking Water

The EPA annually reports the number of systems whose water has violated SDWA standards

The EPA annually reports the number of systems whose water has violated SDWA standards and the total number of people served by these systems. There are five major categories of violations: Maximum Contaminant Level, Monitoring, Maximum Residual Disinfectant Level, Treatment Technique, and Consumer Confidence and Public/State Notification violations. Each of the violation categories is associated with multiple sub-categories and different Rules, Rule Codes, and Contaminants. The corresponding table, found at the end of the chapter, indicates the percentage of each state's population served by a water

system subject to the SDWA that is in violation of any of its rules.

Washington's rank fell to 6th in the nation

It is important to note that some states represent very large outliers that will affect the results. This year Washington's drinking water index increased from 0.1 percent to 0.7 percent. Just four years previously, the state was at 13 percent. Washington's rank also fell to 6th from 4th the prior year. The U.S. average for 2019 was 5.8 percent. Washington's five-year average is 3.0 percent, which is below the five-year U.S. average of 6.8 percent, and ranks 14th in the nation.

Toxins Released

The EPA reports the amount of toxic chemical releases

The Toxics Release Inventory (TRI), reported by the U.S. Environmental Protection Agency (EPA), provides the public with information concerning toxic chemical releases from industrial facilities. Each year, facilities that meet certain thresholds must report their releases and other waste management activities for listed toxic chemicals to the EPA and to the state or tribal entity in whose jurisdiction the facility is located.

Washington doesn't have a widespread presence of high pollutant industries

Before 1998, only facilities in the manufacturing sector were required to report to TRI. Starting in 1994, federal facilities began to report to TRI and in 1998 seven additional industries were added to the required report list. This is the basis for the dramatic increases in the national average for toxins released in 1998 and beyond. States that housed the newly added reporting industries saw a large jump in toxins released beginning in 1998. Washington never saw a noticeable increase in its TRI reports because many of the added industries, such as metal and coal mining, are not widespread in the state.

The U.S. reported an 8.8 percent decrease in toxins in 2019

In 2019, U.S. industries reported an 8.8 percent decrease in their total releases of toxics, from 3.72 billion pounds to 3.39 billion pounds. This figure includes effluent releases directly into the air, water or land, whether it is on-site or off-site landfills, surface impoundments, land treatment facilities, or underground injection wells.

Washington's toxin releases decreased to 379 pounds per square mile

The amount of toxins released in Washington decreased in 2019 to 379 pounds per square mile. This is well below the U.S. average of 912 pounds per square mile. Washington's ranking improved to 16th in the nation. Washington's five-year average is 469 pounds per square mile, and the U.S. average in that same period is 958. Washington's five-year average ranking is 20th in the nation.

Figure 4.6: Toxins Released

State Health Index

The United Health Foundation provides a composite health index for each state

The United Health Foundation America’s Health Rankings provide a composite indicator that measures the relative healthiness of each state and the general health of the population in the United States. The measures that comprise America’s Health Rankings are of two types – determinants and outcomes. Determinants represent those actions that can affect the future health of the population, whereas outcomes represent what has already occurred. Index values represent scores which are the weighted number of standard deviations a state is above or below the national mean.

WA’s health index increased by 0.14, while the rank fell to 12th in the nation

Washington’s health index improved to 0.68 in 2020. On the other hand, Washington’s ranking fell to 12th, from 9th in 2019. Over the years, Washington ranks high amongst the other states. The five-year average for the index is 0.58, ranking Washington 8th. According to the United Health Foundation, Washington’s strengths were: low economic hardship index score, low racial gap in low birthweight, and low prevalence of physical inactivity. Washington’s challenges were: high prevalence of non-medical drug use, high premature death racial inequality, and low percentage of fluoridated water.

State Parks and Recreation Areas

Figure 4.8: State Parks and Recreation Areas

Source: National Association of State Parks Directors. Washington State Parks and Recreation Commission; data through 2019

Washington's park system is more than a century old

Established in 1913, the Washington state park system has provided the public with places to recreate and enjoy for over a century. Washington's park system is one of the most abundant and busiest state park systems in the nation. With over 130 state parks and recreation areas covering about 120,000 acres, Washington ranks 3rd among all 50 states in the number of operating parks and 19th in the amount of park acreage managed.

Washington's per capita visits increased but its ranking remained at 10th in the nation

In 2017, the number of per capita park visits was 5.0, a 0.1 increase from the previous year. Washington's ranking, however, remained at 10th in the nation. The U.S. average was 2.5 park visits per capita. Washington's five-year average was 4.8 visits per capita, and a U.S. average of 2.5. In 2016 and 2017 complete data for Hawaii had not been collected. Absence of these data will affect the U.S. average.

State Arts

Measures art agency funding

The National Assembly of State Arts Agencies (NASAA) reports annual, fiscal year summaries about state art agency revenue. Using data from these fiscal year reports, the State Arts indicator expresses funding for state art programs and allows for state-to-state comparisons. The estimates for total per capita state arts agency revenue that are shown in Table 4.9 are calculated by totaling state legislative appropriations, other state funds, federal funds from sources such as the National Endowment for the Arts (NEA), and other non-federal funds received. Though arts agencies are the primary source of funding, some states also fund the arts through other agencies, such as arts education through the Department of Education; this funding is not included in the data.

Per capita arts funding was 12th lowest in the nation

Washington's per capita state arts revenue increased from \$0.71 in 2020 to \$0.77 in 2021. Washington's ranking increased to 39th in the nation. Washington's per capita state art revenue has always been lower than the U.S. average. However, \$0.77 per capita is Washington's highest state arts revenue to date. Washington's five-year average is \$0.63 per capita, which ranks 43rd.

Figure 4.9: State Arts

Public Library Service

Measures the amount of circulation per capita

The United States Institute of Museum and Library Services administers the Public Library Survey. The survey has been conducted annually since 1988 and monitors the state of public libraries across the nation. In this climate study, the public library service indicator ranks each state's public library service by measuring the amount of circulation (or the amount of media such as books, videos, or musical recordings checked out at each library) per capita.

Figure 4.10: Public Library Service

Source: U.S. Department of Education. National Center for Education Statistics; data through 2019

Washington's ranking remained 3rd in per capita circulation

Washington's ranking for circulation per capita in 2019 remained at 3rd in the nation, with the metric increasing 0.1 circulations per capita. In 2019, per capita circulation was 11.4 and the U.S. average was 6.9. Washington has consistently been above the U.S. average. Washington's average for 2014-2018 is 11.5, ranking 3rd among the states.
